How a US Company Plans to Implant Microchips in its Employees

Tech can offer conveniences as well as not having to get out of your car to open the garage door or not having to get off the safe to change the channel on the TV.

How one US company is offering employees a new convenience – something an employee at the company has to do, but you won’t hear them talk about with anyone outside of work.

Three Square Market, a Wisconsin-based company, is offering employees technology in all of their employees for free.

These chips allow employees in the workplace and can also be used outside the workplace at any time.

When employees arrive at work, they present their iD cards with the chip. Employees can use this card for time and attendance, as well as to access the workplace.

Participation in the program is voluntary, and all full-time US employees who sign up will receive a chip.

Employees who want to participate but don’t want to purchase a new card can use their own NFC smartphone to present the chip to the reader.

The chip does not store any GPS device or other location data.

Employees are given a new identity card with the chip in it. The chip is only visible to the reader and not to the person holding the card.

Employees can also use the chip to enter the workplace and to access the employee’s personal information.

In the future, people with chips may be able to move without the need for a ticket or passport.

Eventually, this technology will allow standardized data exchange for all forms of identification.
